

100 Days of Linux - Day 003

Title: Creating Directories with mkdir

Today's Goal

Learn how to create directories using **mkdir** and navigate between them using **cd**.

Why This Matters

Organizing folders is an everyday task for developers and data engineers when working with projects, datasets, scripts, and logs.

Command of the Day: mkdir

Syntax: mkdir directory_name

Explanation: Creates a new directory.

Common Option: mkdir -p parent/child (creates nested folders).

Example: mkdir projects

Beginner Lesson

A directory is another name for a folder. Linux stores files inside directories. Today you'll create your own folders and move into them using **cd**. Use **pwd** to confirm your location and **ls** to verify the folders you created.

Practice Questions

1. Create a directory named linux_practice in your Home directory.
2. Move into the linux_practice directory and display your current location.
3. Inside linux_practice, create a directory named day03.
4. Return to your Home directory and list its contents.
5. Create two directories named data and scripts inside linux_practice using a single command.

Hints

Remember the commands: mkdir, cd, pwd, and ls. You can create multiple directories in one mkdir command.

Mini Challenge

Create a folder named projects. Inside it create folders python, sql, and linux. Move into the linux folder and display your current path.

Common Mistakes

Trying to create a folder that already exists or forgetting to move into the correct directory before creating folders.

Did You Know?

Linux allows spaces in folder names, but it's recommended to

avoid them and use underscores (_) or hyphens (-).

Pro Tip

Press the Tab key to auto-complete folder names and avoid typing mistakes.

Answer Key (Instructor Only)

Q1: `cd ~ && mkdir linux_practice`

Q2: `cd linux_practice && pwd`

Q3: `mkdir day03`

Q4: `cd ~ && ls`

Q5: `cd ~/linux_practice && mkdir data scripts`

Homework

Create a practice folder and experiment with creating and navigating through at least five new directories.

Next Day Preview

Tomorrow you'll learn how to create files using the touch command and continue building your Linux workspace.
