

100 Days of Linux - Day 062

Title: Your First Bash Shell Script

Today's Goal

Learn how to create, make executable, and run your first Bash shell script.

Why This Matters

Shell scripts automate repetitive Linux tasks. Data engineers use them to schedule ETL jobs, back up files, run Python programs, and automate deployments.

Commands of the Day

Shebang:

```
#!/bin/bash
```

Create a script:

```
nano hello.sh
```

Make executable:

```
chmod +x hello.sh
```

Run the script:

```
./hello.sh
```

or

```
bash hello.sh
```

Example Script:

```
#!/bin/bash
echo "Hello, Linux!"
echo "Welcome to Shell Scripting"
```

Beginner Lesson

A shell script is simply a text file containing Linux commands. Instead of typing the same commands repeatedly, you save them in a file and execute them whenever needed.

Practice Questions

1. Create a script named hello.sh that prints 'Hello, Linux!' and 'Welcome to Bash Scripting'.
2. Make hello.sh executable using chmod, then run it with ./hello.sh.
3. Run the same script using bash hello.sh.
4. Modify hello.sh to also print today's working directory using the pwd command.
5. Display your current working directory after completing today's tasks.

Hints

Always start Bash scripts with #!/bin/bash. If './script.sh' shows Permission denied, make it executable with chmod +x.

Mini Challenge

Create project_setup.sh that prints a welcome message, your

current user, current directory, and today's date using echo, whoami, pwd, and date.

Common Mistakes

Forgetting the shebang, not making the script executable, or trying to run it from the wrong directory.

Did You Know?

Many production ETL pipelines begin with Bash scripts that prepare the environment before launching Python or Spark jobs.

Pro Tip

Keep scripts organized in a dedicated scripts/ folder and give them meaningful names such as backup.sh or run_pipeline.sh.

Answer Key (Instructor Only)

Q1: Create hello.sh with the sample script

Q2: chmod +x hello.sh && ./hello.sh

Q3: bash hello.sh

Q4: Add 'pwd' to the script and rerun it

Q5: pwd

Homework

Create three simple scripts: greet.sh, system_info.sh, and project_setup.sh. Run each using both './script.sh' and 'bash script.sh'.

Next Day Preview

Tomorrow you'll learn how to use variables inside Bash scripts to store and reuse values.
