

100 Days of Linux - Day 077

Title: Networking Revision Quiz

Today's Goal

Review and strengthen your understanding of the networking commands learned so far: **ping**, **curl**, **wget**, **ssh**, **scp** and **ip**.

Why This Matters

Regular revision helps you remember commands and prepares you for real troubleshooting tasks in Linux environments.

Revision Summary

ping checks connectivity, curl retrieves web content, wget downloads files, ssh connects securely to remote systems, scp transfers files securely, and ip displays network information.

Practice Questions

1. Check whether google.com is reachable.
2. Display only the HTTP headers for https://example.com.
3. Download a file named sample.txt from a URL using wget.
4. Show your system's IP addresses.
5. Write the command to securely copy report.txt to a remote server.

Hints

Think about which command is designed for connectivity, downloading, remote login, secure copy and network information.

Mini Challenge

Use at least four different networking commands from this week's lessons to inspect your system and download a sample webpage.

Common Mistakes

Mixing up curl and wget, using the wrong option with scp, forgetting Ctrl+C when using ping, or confusing ip addr with ip link.

Did You Know?

Many Linux troubleshooting sessions begin with ping followed by ip and curl to isolate network issues.

Pro Tip

Practise commands repeatedly in WSL until you can remember them without looking at notes.

Answer Key (Instructor Only)

- Q1: ping google.com
Q2: curl -I https://example.com
Q3: wget https://example.com/sample.txt
Q4: ip addr
Q5: scp report.txt user@server:/home/user/

Homework

Create a Markdown file listing each networking command learned this week along with one practical example.

Next Day Preview

Tomorrow you'll begin a practical networking assignment that combines all of these commands.
