

100 Days of Linux - Day 078

Title: Practical Networking Assignment

Today's Goal

Apply all the networking commands learned this week by completing a realistic hands-on assignment.

Why This Matters

Real Linux jobs require combining multiple networking commands to diagnose problems, download resources and work with remote systems.

Scenario

Imagine you have joined a new project. Before starting work, you need to verify network connectivity, inspect your machine's network settings, download project files and prepare commands for connecting to a remote server.

Practical Assignment (Exactly 5 Tasks)

1. Verify internet connectivity by pinging google.com with 4 requests.
2. Display your IP addresses and routing table using the ip command.
3. Retrieve the HTTP headers from https://example.com using curl.
4. Download a sample file using wget and verify it exists with ls.
5. Write the scp command to upload report.txt to a remote server and the ssh command to connect to that server.

Hints

Review the syntax of ping, ip, curl, wget, ssh and scp before starting. Complete one task at a time.

Mini Challenge

Create a Markdown file named networking_report.md listing every command you used and a one-line description of its purpose.

Common Mistakes

Using incorrect URLs, confusing curl with wget, forgetting options such as -c or -I, or mixing up ssh and scp syntax.

Did You Know?

Many automated deployment scripts begin by checking connectivity before downloading configuration files or connecting to servers.

Pro Tip

Practise these commands regularly in WSL so they become second nature during troubleshooting.

Answer Key (Instructor Only)

Q1: ping -c 4 google.com

Q2: ip addr and ip route

Q3: curl -I https://example.com

Q4: wget https://example.com/sample.txt then ls

Q5: scp report.txt user@server:/home/user/ and ssh user@server

Homework

Repeat today's assignment without referring to your notes and record any commands you found difficult.

Next Day Preview

Tomorrow you'll continue with more advanced networking practice and troubleshooting exercises.
