

100 Days of Linux - Day 080

Title: Networking Mini Project

Today's Goal

Complete a small project that combines all networking commands learned in Days 71–79.

Why This Matters

Real-world Linux work involves using several commands together to verify connectivity, inspect systems, download resources and prepare remote access.

Scenario

You have joined a new Linux server. Before starting work, perform a complete network health check and prepare the system for remote administration.

Mini Project (Exactly 5 Tasks)

1. Verify internet connectivity using **ping -c 4 google.com**.
2. Display your IP addresses and routing table using **ip addr** and **ip route**.
3. Retrieve only the HTTP headers from **https://example.com** using **curl -I**.
4. Download a sample file with **wget** and confirm it exists using **ls**.
5. Write the **ssh** command to connect to a remote server and the **scp** command to upload a file named report.txt.

Hints

Complete the tasks in order. Check each command's output before moving to the next step.

Mini Challenge

Create a Markdown file named **network_project_report.md** describing each command you used and its purpose.

Common Mistakes

Skipping connectivity tests, confusing curl with wget, using incorrect SSH syntax, or forgetting to verify downloaded files.

Did You Know?

A structured troubleshooting process can solve many network issues in just a few minutes.

Pro Tip

Keep a personal cheat sheet of commonly used networking commands for quick reference.

Answer Key (Instructor Only)

Q1: **ping -c 4 google.com**

Q2: **ip addr** and **ip route**

Q3: **curl -I https://example.com**

Q4: **wget https://example.com/sample.txt** then **ls**

Q5: **ssh user@server** and **scp report.txt user@server:/home/user/**

Homework

Repeat the complete mini project without referring to today's lesson and record any commands you found difficult.

Next Day Preview

Tomorrow you'll begin the Environment Variables module with the **env** and **printenv** commands.
