

100 Days of Linux - Day 089

Title: Searching Packages and Viewing Package Information

Today's Goal

Learn how to search for software packages and view package details using the **apt** command.

Why This Matters

Before installing software, Linux users often search for packages, read descriptions and confirm package availability.

Commands of the Day

Syntax:

```
apt search keyword
apt show package_name
apt list --installed
```

Examples:

```
apt search git
apt show tree
apt list --installed
```

Beginner Lesson

Use **apt search** to find packages related to a keyword. Use **apt show** to view details such as version, description and dependencies. Use **apt list --installed** to display installed packages.

Practice Questions

1. Search for the git package.
2. View information about the tree package.
3. List all installed packages.
4. Search for packages related to python.
5. Display information about the curl package.

Hints

Use **apt search** for keywords and **apt show** for package details.

Mini Challenge

Find three packages related to development tools and record their names and descriptions in a Markdown file.

Common Mistakes

Using incorrect package names, confusing **apt search** with **apt show**, or forgetting that searches may return many results.

Did You Know?

Ubuntu repositories contain thousands of software packages that can be searched directly from the terminal.

Pro Tip

Always read a package description before installing unfamiliar software.

Answer Key (Instructor Only)

- Q1: apt search git
Q2: apt show tree
Q3: apt list --installed
Q4: apt search python
Q5: apt show curl

Homework

Search for five useful command-line tools and write one sentence about each package.

Next Day Preview

Tomorrow you'll complete the package management module with a practical assignment.
