

100 Days of Linux - Day 090

Title: Practical Assignment – Package Management with apt

Today's Goal

Apply everything learned about Ubuntu package management by completing a realistic hands-on assignment.

Why This Matters

Managing software is a daily responsibility for Linux administrators, developers and DevOps engineers. This assignment combines package installation, upgrades, searching and removal.

Scenario

You are setting up a new Ubuntu development machine. Before writing code, you need to update the system, install tools, inspect packages and clean up unused software.

Practical Assignment (Exactly 5 Tasks)

1. Refresh the package list using apt.
2. Install the **tree** package and verify it works.
3. Search for the **git** package and display its information.
4. Upgrade installed packages, then remove **tree** and reinstall it.
5. Run **apt autoremove** and list all installed packages.

Hints

Run **apt update** before installing or upgrading. Use **apt search** and **apt show** to inspect packages.

Mini Challenge

Create a Markdown file named **package_report.md** listing every apt command you used and one sentence explaining its purpose.

Common Mistakes

Skipping **apt update**, misspelling package names, removing the wrong package or ignoring confirmation prompts.

Did You Know?

Ubuntu repositories contain tens of thousands of packages that can be installed directly with apt.

Pro Tip

Read the package summary carefully before pressing **Y** during installation or upgrades.

Answer Key (Instructor Only)

Q1: `sudo apt update`

Q2: `sudo apt install tree, tree`

Q3: `apt search git, apt show git`

Q4: `sudo apt upgrade, sudo apt remove tree, sudo apt install tree`

Q5: `sudo apt autoremove, apt list --installed`

Homework

Install one additional command-line utility, read its documentation and record what problem it solves.

Next Day Preview

Tomorrow you'll begin the Shell Scripting module by creating and running your first Bash script.
