

100 Days of Linux - Day 098

Title: Bash Scripting Revision Quiz

Today's Goal

Review the Bash scripting concepts covered from Days 91–97.

Why This Matters

Revision strengthens your understanding before moving on to the final scripting challenges.

Quick Revision

Topics covered: Bash scripts, variables, user input, command-line arguments, if/elif/else, for loops and while loops.

Revision Quiz

1. What is the purpose of the `#!/bin/bash` line?
2. How do you print the value of a variable?
3. Which command accepts user input?
4. What does `$1` represent?
5. Which keyword ends an if statement?
6. Which loop is best for iterating over a list?
7. Which loop continues while a condition is true?
8. What causes an infinite while loop?
9. What does `$#` return?
10. Write one practical use of Bash scripting.

Mini Challenge

Write a script that asks for a user's name, accepts an age, checks whether the age is 18 or above, and prints a personalised message.

Common Mistakes

Forgetting `fi` or `done`, missing the dollar sign when reading variables, and not updating counters in while loops.

Did You Know?

Many deployment and backup tools are powered by simple Bash scripts built from these basic concepts.

Pro Tip

Practise by typing every script yourself instead of copying and pasting.

Answer Key (Instructor Only)

1. Specifies the Bash interpreter.
2. `echo $VARIABLE`
3. `read`
4. First command-line argument.
5. `fi`
6. for loop
7. while loop
8. Counter/condition never changes.
9. Number of command-line arguments.
10. Example: automating backups.

Homework

Recreate one script each for variables, conditions, for loops and while loops without looking at previous notes.

Next Day Preview

Tomorrow you'll build a complete Bash scripting mini project.
